## Robot Construction Competition

The Robot Construction Competition was the highlight of the tech fair. Each team had a specific section to build and demonstrate their robot's functions.

Jake's team focused on the construction of the robot's arms, ensuring they could lift objects with precision. Mia's team worked on the navigation system, programming the robot to move in all directions without collision. Ethan's team designed the communication module, allowing the robot to follow voice commands.

During the competition, the judges paid close attention to each robot's performance. There was a moment of tension when one robot experienced a malfunction, but the team quickly fixed the situation.

The evaluation process was thorough, with points given for innovation and execution. When the final decision was announced, the winning team received a standing ovation for their exceptional creation.

The competition inspired everyone to think about the future of robotics and their own potential for invention.
