## Rainbow Experiment

In the science lab, a group of students was conducting a fascinating experiment. Their assignment was to create a rainbow using different materials.

They mixed water with various substances to produce colorful effects. The first element they used was salt, which helped in forming tiny crystals. Then, they added vinegar to the mixture, causing a chemical reaction.

The experiment required patience as they waited for the rainbow to emerge. Finally, after several minutes, they observed the magical moment when the rainbow appeared.

The experiment brought excitement and amazement to everyone in the room. The students carefully documented their findings in their notebooks, proud of their achievement.
