1. The release of gases and particles into the atmosphere from sources like vehicles and factories, leading to air quality issues.
2. Synthetic polymers used in countless products that persist in the environment and harm wildlife.
3. Discarded materials that accumulate in natural habitats, leading to environmental degradation.
4. Harmful substances that pollute air, water, or soil, posing risks to health and ecosystems.
5. Tiny fragments of synthetic materials found in water bodies and organisms, disrupting ecosystems.
6. A dense haze resulting from the interaction of pollutants and sunlight, reducing visibility and air quality.
7. Improperly disposed items scattered in public spaces and natural environments, creating unsightly conditions.
8. Substances that are poisonous and can cause significant harm to living organisms and habitats.
9. Various compounds that, when released into the environment, can have adverse effects on nature and health.
10. Petroleum-based liquids that can cause severe damage to marine and terrestrial ecosystems when spilled or leaked.
