## The Life Cycle of an Aardvark

### Short Answer Key

1. The cub depends on its mother for warmth, protection, and milk.
2. The cub learns by observing its mother dig and find food.
3. An aardvark becomes independent at around one year old.
4. Aardvarks dig burrows for shelter, protection, and raising their young.
5. Aardvarks control insect populations and create shelters for other animals.
