## How Does an Aardvark Move?

### Short Answer Key

1. Aardvarks move mostly at night to avoid predators and stay safe.
2. Their strong legs and sharp claws help them move efficiently on land.
3. Aardvarks use their claws to dig burrows and search for food underground.
4. A unique feature of how aardvarks move is their slow but steady pace combined with powerful digging.
5. Aardvarks don't climb trees or swim because their bodies are better suited for digging and walking on land.
