

Name _____

How Do Angelfish Communicate?

Short Answer Key

1. Angelfish use their fins to communicate by spreading them wide to look larger and warn other fish or using gentle movements to show they are calm.
2. Some angelfish use their colors to blend into their surroundings to hide from predators or stay safe.
3. When a pair of angelfish swims side by side, it usually means they are ready to reproduce.
4. Schools of freshwater angelfish protect themselves by quickly swimming together in the same direction when a predator is nearby.
5. Observing angelfish communication is important for scientists because it helps them understand how these fish interact and survive in their environments.
