

Name _____

Angelfish: Predators and Perils

Short Answer Key

1. One predator of freshwater angelfish is a larger cichlid or a pike.
2. Angelfish use their colors and patterns to blend into coral reefs or underwater plants, making it harder for predators to see them.
3. Humans harm angelfish habitats by polluting the water or causing damage to coral reefs through climate change.
4. Diseases and parasites can make angelfish weak, sick, or uncomfortable, reducing their chances of survival.
5. Swimming in schools helps angelfish avoid predators by making it harder to focus on a single fish.
