

Name _____

How Do Angelfish Move?

Short Answer Key

1. Angelfish use their pectoral fins to steer and make precise movements.
2. Angelfish are not fast swimmers because they are built for control and precision, which helps them navigate their environment.
3. Angelfish hover in place by gently moving their pectoral fins.
4. Careful swimming helps angelfish search for food in tight spaces and avoid bumping into obstacles like coral or plants.
5. Angelfish warn other fish to stay away by flicking their fins or darting forward.
