## What Does an Armadillo Eat?

### Open-Ended Response Answer Key

1. Armadillos prefer insects because they are easy to find and full of protein.
2. Their claws help them dig, their nose helps them smell food, and their shell protects them from predators.
3. I would dig in soft soil, sniff for insects, and use my sticky tongue to catch bugs for dinner.
4. If in a colder area, they might eat more plants or small animals instead of insects.
