

Name _____

How Does an Armadillo Move?

Short Answer Key

1. Armadillos stay safe by running, digging burrows, and using their protective shell.
2. Armadillos have strong legs and sharp claws that help them dig easily.
3. Armadillos can hold their breath for six minutes and inflate their stomach to float.
4. Armadillos can't climb tall trees easily due to their body structure and short legs.
5. The shell protects the armadillo and allows it to move safely without injury.
