

Name _____

The Barracuda's Role in the Ocean Ecosystem

Short Answer Key

1. Barracudas keep smaller fish populations under control by hunting and eating them.
2. Barracudas strengthen fish populations by preying on weak or sick individuals, allowing stronger fish to survive and reproduce.
3. Sharks and dolphins are two predators of barracudas.
4. Protecting coral reefs is important for barracudas because reefs provide habitats for hunting and shelter.
5. Overfishing reduces barracuda numbers, disrupting their role in controlling smaller fish populations and affecting the ocean's balance.
