## Wings Across Continents: The Fascinating World of Bird Migration

### Short Answer Key

1. Bird migration is driven by changes in daylight length, temperature, food availability, and breeding cycles.
2. Birds navigate during migration by using a combination of visual landmarks, celestial cues, and possibly Earth's magnetic field.
3. One example of a bird species known for its long-distance migration is the Arctic tern.
4. One purpose of migration for birds is to access abundant food sources and avoid competition for resources.
5. Birds migrate northward in spring to breed and raise their young in regions with ample resources.
