

Name _____

What Does a Bumblebee Eat?

Open-Ended Response Answer Key

1. Bumblebees are important because they help plants grow by spreading pollen, which supports the production of fruits, vegetables, and flowers.
2. The relationship between bumblebees and flowers is mutual. Bumblebees get food from flowers, and flowers get pollinated, which helps them produce seeds and fruits.
3. If bumblebees couldn't find enough flowers, plants would not be pollinated as much. This could lead to fewer fruits and vegetables for humans to eat.
4. People can help bumblebees by planting more flowers, avoiding pesticides, and creating gardens with plants that bloom throughout the year.
