## Bumblebees: Nature's Little Helpers

### Short Answer Key

1. Bumblebees move pollen from one flower to another, helping plants grow seeds and fruits.
2. Apples and tomatoes are two crops that depend on bumblebees for pollination.
3. Buzz pollination helps shake pollen loose from flowers like tomatoes and blueberries, which other insects cannot do as well.
4. Two threats to bumblebee populations are pesticides and habitat loss.
5. People can plant flowers, reduce pesticide use, and protect natural habitats to help bumblebees.
