## How Does a Cheetah Move?

### Open-Ended Response Answer Key

1. The cheetah's speed helps it catch prey quickly, increasing its chances of survival.
2. Cheetahs rarely climb trees because they are built for speed on the ground, not climbing.
3. If cheetahs couldn't run fast, they might struggle to catch prey and survive.
4. Conserving energy is important because cheetahs need bursts of speed for hunting and must recover afterward.
