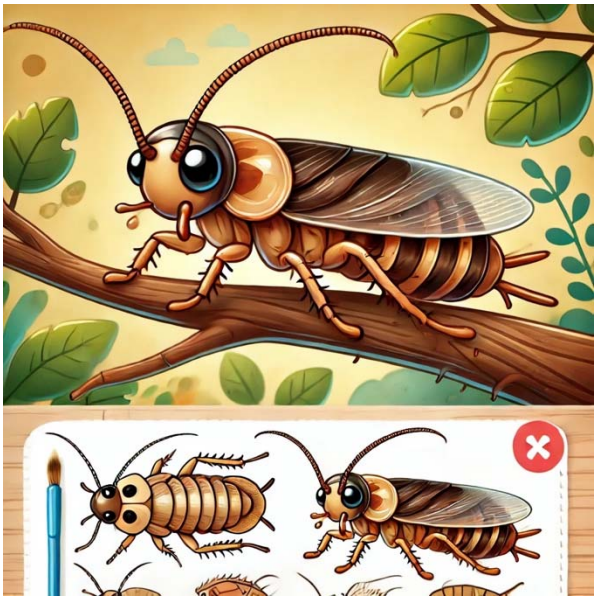
Name _____



What Does a Cockroach Look Like?

Cockroaches are some of the most interesting insects on Earth. They have a unique look that makes them stand out, even if some people would rather not see one up close!

Cockroaches are small insects, but their size can vary depending on the type. Most cockroaches are about half an inch to two inches long. Some tropical species can grow much larger, up to four inches! Cockroaches don't weigh much; even the largest ones are only a few grams. Their light weight helps them move quickly when they need to escape predators.

Cockroaches usually have a flat, oval-shaped body. This shape allows them to squeeze into tight spaces like cracks in walls or under furniture. Their outer shell is hard and shiny, usually brown or black in color. Some cockroaches have lighter or darker stripes, especially on their backs. These stripes can help scientists identify different species.

One of the most recognizable parts of a cockroach is its long antennae. These thin, wiggly structures help the insect sense its surroundings, especially in the dark. Cockroaches also have six legs, which are covered in tiny spines. These spines help them climb walls and even walk upside down! Another unique feature is their wings. While not all cockroaches can fly, many have wings that help them glide short distances.

Cockroaches are also known for their big eyes. Their eyes are made up of many smaller lenses, which help them see movement around them. This is one reason why cockroaches are so good at avoiding danger—they can spot a threat from almost any direction!

With their unusual features, cockroaches are perfectly designed to survive in many environments. Although they might seem simple at first glance, these insects are full of fascinating details when you take a closer look.
