

Name _____

What Does a Cricket Look Like?

Open-Ended Response Answer Key

1. Crickets are good at surviving in the wild because they can camouflage, jump far to escape predators, and have sensitive antennae to detect danger and food.
2. A cricket's color helps it blend into its surroundings, making it harder for predators to find them, while their small size makes them less noticeable.
3. Observing a cricket's long antennae and powerful hind legs would be interesting because they are unique and essential for its survival.
4. Without long antennae, crickets would struggle to find food and avoid predators because they rely on their antennae to sense their environment.
