## A Day in the Life of a Cricket

### Open-Ended Response Answer Key

1. Crickets are more active at night because it is safer for them to find food and mates without being seen by predators.
2. As a cricket, I would spend the night chirping to find a mate, searching for food, and staying alert for predators.
3. Chirping helps male crickets survive and reproduce by attracting females for mating and warning other males to stay out of their territory.
4. It is important for crickets to sense predators because it allows them to react quickly and find safety, helping them survive in their environment.
