

Name _____

Hopping, Running, and Flying: How Crickets Move

Short Answer Key

1. A cricket's back legs are strong and act like springs, helping them jump far distances.
2. Crickets use running to move quickly through their surroundings, making it harder for predators to catch them.
3. Crickets don't rely on flying as much because their wings are better suited for short distances rather than long flights.
4. Crickets use their antennae to sense their surroundings, helping them navigate and avoid danger.
5. Crickets might need to move quickly to escape predators or search for food.
