Crocodile Homes: Wet and Wild Habitats

Crocodiles are large reptiles that live in warm parts of the world. They prefer places with plenty of water. Crocodiles are often found in rivers, lakes, swamps, and wetlands. Some species also live in saltwater habitats like mangrove

swamps and coastal areas. These habitats provide the water they need to stay cool and hunt for food.

Crocodiles can be found in many parts of the world, especially in Africa, Asia, Australia, and the Americas. The Nile crocodile, for example, is common in many African countries, while the saltwater crocodile is often seen in Australia and Southeast Asia. American crocodiles live in parts of Central and South America, including Florida.

These reptiles choose habitats where they can hide and hunt. The muddy waters and dense plants help them blend in, making it easier to catch prey. Crocodiles are also excellent swimmers, using their powerful tails to move through the water quickly.
