

Name _____

Crocodile's Diet: Carnivore Kings

Crocodiles are carnivores, which means they eat meat. They are powerful hunters with strong jaws and sharp teeth designed for catching and holding prey. Crocodiles often live in rivers, lakes, and wetlands where they can find plenty of food.

A crocodile's diet mainly includes fish, birds, and mammals. Young crocodiles may eat insects, frogs, and small fish. As they grow bigger, their meals become larger too. Adult crocodiles can hunt animals as large as deer or even buffalo. Crocodiles do not chew their food but use their strong teeth to grip and tear it into smaller pieces.

Crocodiles hunt using stealth and surprise. They can stay very still in the water, with only their eyes and nose above the surface. When prey comes close, they strike quickly, using their powerful jaws to grab and pull the animal underwater.

Crocodiles also have a special way of digesting food. They can eat large meals and go for a long time without eating again. This helps them survive in areas where food is not always available.
