

Name _____

The Life Cycle of a Deer

Open-Ended Response Answer Key

1. A deer's life cycle includes being a fawn, growing into a juvenile, becoming an adult, and eventually growing old.
2. Staying hidden helps protect fawns from predators while they are young and unable to defend themselves.
3. Antlers help male deer attract mates and show strength during mating season.
4. Without a safe place to grow, deer might not survive or learn the skills they need to live in the wild.
