

Name _____

Fantastic Frogs - Open-Ended Answer Key

1. Frogs help control insect populations, which keeps the ecosystem balanced. They are also food for many other animals, making them an important part of the food chain.

2. Frog populations could decrease or disappear, which would harm the ecosystem. Insects might increase without frogs to eat them, and animals that eat frogs would lose a food source.

3. I might see the frog hopping around, catching insects with its sticky tongue, or sitting quietly to blend in with its surroundings. It might be near water to keep its skin moist.

4. The bright colors warn predators that the frog might be poisonous or dangerous, so predators are less likely to eat them.
