## The Gorilla's Home: Forest Giants

### Open-Ended Response Answer Key

1. Mountain gorillas live in cooler, foggy forests at high altitudes, while lowland gorillas live in warmer rainforests.
2. Gorillas stay mostly on the ground because of their large size and weight, which makes climbing trees difficult.
3. If forests were destroyed, gorillas would lose their food source and shelter, leading to endangerment.
4. People can help by stopping deforestation, creating national parks, and supporting conservation programs.
