

Name _____

Guppies: Small Fish with a Big Role in the Ecosystem

Short Answer Key

1. Guppies eat mosquito larvae, preventing them from growing into adult mosquitoes.
2. Guppies are important because they provide food for larger animals like fish and birds.
3. Guppies eat algae, which helps prevent it from growing too much and harming the water.
4. Without guppies, predators might not have enough food, and mosquito populations could grow too large.
5. Scientists study guppies to learn about adaptation, reproduction, and ecosystem balance.
