

Name _____

Where Do Houseflies Call Home?

Houseflies are one of the most common insects in the world, and they can be found almost anywhere people live. These adaptable insects thrive in many different environments, but they have specific preferences for their habitats.

Houseflies prefer places where they can find food, warmth, and shelter. They are

commonly found near garbage, compost, and animal waste because these areas provide plenty of food for them. This is why you might see houseflies buzzing around trash cans, barns, or outdoor picnics.

While houseflies are not picky about their surroundings, they don't live everywhere. For example, they avoid forests, oceans, and cold mountain regions where food is scarce and temperatures are too low. Instead, they choose warmer places like cities, towns, and farms. Houseflies are especially common in places where humans and animals live close together because these areas often have the waste and food scraps that flies need to survive.

Did you know houseflies are found on every continent except Antarctica? They thrive in tropical regions, where the weather is warm and food is plentiful. However, they also adapt to cooler places by living inside homes, barns, and other structures that provide shelter.

Because houseflies are so adaptable, they have become a part of daily life in many parts of the world. Even though they can be annoying, they play an important role in the environment by helping break down waste. This makes them an essential part of nature's cleanup crew, even if we wish they'd stop landing on our food!
