

Name _____

Where Do Jellyfish Live?

Jellyfish are fascinating sea creatures that can be found in oceans all around the world. They live in saltwater habitats, which means they are commonly seen in seas and oceans but not in freshwater lakes or rivers. Jellyfish prefer different ocean zones depending on their

species. Some live near the surface where sunlight reaches the water, while others drift in the deep, dark parts of the ocean where no sunlight can reach.

Jellyfish can be found in both warm and cold waters. Some species, like the moon jellyfish, are often found near the shore in shallow, calm waters. Others, like the lion's mane jellyfish, thrive in colder Arctic waters. There are even jellyfish in tropical coral reefs, where they add to the beautiful underwater scenery.

Jellyfish do not have control over where they swim. Instead, they drift along with ocean currents. This drifting lifestyle makes them very adaptable, as they can be found in almost every ocean on Earth. They can be seen near beaches, in open waters, and even in the deepest parts of the ocean.

Even though jellyfish can be found almost everywhere, they need the right conditions to survive. They thrive in saltwater and need areas where they can find food, such as plankton and small fish. Some jellyfish even live in special habitats like lagoons or bays where water stays calm and warm.
