## What Does a Jellyfish Eat?

### Open-Ended Response Answer Key

1. Jellyfish have stinging cells because they can't chase or bite prey.
2. Without jellyfish eating plankton, there might be too many plankton and not enough balance in the ocean.
3. If jellyfish couldn't catch food, they would starve and the ocean food chain would change.
4. Adding small shrimp or crabs could balance their diet and match their feeding style.
