

Name _____

How Do Jellyfish Reproduce?

Open-Ended Response Answer Key

1. Jellyfish release many eggs because most will not survive due to predators and conditions.
2. The jellyfish life cycle allows them to survive by producing many young and reproducing in multiple ways.
3. Changing the lack of care for young could help more survive, though jellyfish have survived for millions of years.
4. The polyp stage helps prepare jellyfish by producing multiple offspring and starting their life cycle.
