## What Does a Jellyfish Look Like?

Jellyfish are amazing ocean animals with a unique look. They have soft, bell-shaped bodies and long, flowing tentacles. Some jellyfish are small, only the size of a marble, while others, like the lion's mane jellyfish, can be as large as a grown person with tentacles

stretching over 100 feet! Most jellyfish are almost see-through and can come in colors like pink, blue, purple, or even glow in the dark.

A jellyfish's body is mostly water and does not have bones, a brain, or a heart. Instead, they use their tentacles for both movement and catching food. Their tentacles have tiny stinging cells that help them catch small sea creatures for food.

One unique feature of jellyfish is their ability to glow in the dark. This ability, called bioluminescence, can scare away predators or attract food. Some jellyfish have special patterns on their bells, like stripes or spots, which make them even more fascinating to look at.

Jellyfish have been around for millions of years and can be found in oceans all over the world. Some stay near the surface, while others drift deep under the sea. Despite their beauty, some jellyfish can be dangerous. Their stings can range from mild to extremely painful, and a few, like the box jellyfish, have venom that can be deadly.
