

Name _____

The Role of Koi Fish in the Ecosystem

Short Answer Key

1. Koi fish eat insects and larvae, which helps control insect populations.
2. Koi fish eat algae to prevent it from growing too quickly and harming the ecosystem.
3. Koi fish are both predators of smaller organisms and prey for larger animals, making them a key part of the food chain.
4. When koi stir up mud, they help circulate nutrients that are beneficial for plants and other aquatic life.
5. Koi fish help aquatic plants by keeping the water clean and oxygen-rich, which supports plant growth.
