

Name _____

The Life Cycle of a Komodo Dragon

Open-Ended Response Answer Key

1. Young Komodo dragons stay in trees to avoid being eaten by larger predators, including adult Komodo dragons.
2. Each life stage provides unique survival advantages, such as staying in trees when young and hunting larger prey as adults.
3. Baby Komodo dragons face threats from predators and competition for food.
4. Protecting Komodo dragons is important because they help balance their ecosystem and are a rare species.
