## How Clouds Help Scientists Predict Weather

### Short Answer Key

1. Clouds form when warm air rises, cools, and releases moisture as water droplets or ice.
2. They can turn into cumulonimbus clouds and bring thunderstorms.
3. They often signal that rain or snow may come soon.
4. They study clouds, temperature, wind, radar images, and satellite data.
5. Cumulus (fair weather), Stratus (light rain or drizzle)
