

Name _____

Where Do Mosquitoes Live?

Mosquitoes are some of the most widespread insects in the world. You can find them almost everywhere, from the warm, humid tropics to cold, snowy areas. However, there is one place where mosquitoes do not live: Antarctica! This icy continent is far too cold and dry for mosquitoes to survive.

Mosquitoes prefer habitats with plenty of water, as this is where they lay their eggs. They thrive in places like forests, wetlands, marshes, and even small puddles in your backyard. Some species live in tropical rainforests, where the warm weather and frequent rain provide ideal conditions. Others can be found in grassy areas, near lakes or rivers, or even in urban neighborhoods. All mosquitoes need is a bit of standing water to reproduce.

In addition to water, mosquitoes like warm climates. This is why you will find more mosquitoes buzzing around during summer. In colder areas, mosquitoes survive by hibernating during the winter months. They hide in tree holes, caves, or basements until the weather gets warmer.

Mosquitoes are found on every continent except Antarctica, and they are especially common in Africa, Asia, and South America. In these regions, the warm weather and wet seasons create the perfect environment for mosquitoes to thrive. Even in places like North America and Europe, mosquitoes are a common sight in the summer.

Wherever there is water, warmth, and food, mosquitoes will be nearby. They have adapted to live in many different environments, which is one reason they are so successful as a species. The next time you see a mosquito in your backyard or hear one buzzing by your ear, remember that they are perfectly suited to life almost anywhere on Earth.
