

Name _____

Moth Talk: How Moths Communicate

Short Answer Key

1. Pheromones are special scents released by female moths to attract males, helping them find mates.
2. Tiger moths make clicking sounds to confuse bats and disrupt their ability to hunt.
3. The patterns on moths' wings can look like the eyes of larger animals, scaring away predators.
4. Fireflies use flashes of light to signal mates and communicate with other moths.
5. Caterpillars don't communicate much because they are focused on eating and growing to prepare for the next stage of their life.
