

Name _____

Moth Survival: Predators and Threats

Open-Ended Response Answer Key

1. Predators hunt moths directly, while parasites harm them by attacking their caterpillars, making it harder for moths to grow and reproduce.
2. Light pollution disrupts the natural behavior of moths, making it hard for them to navigate, find food, or mate, which can reduce their populations.
3. Humans can help moths by reducing pesticide use, protecting forests, and turning off unnecessary lights at night.
4. Answers will vary but may include ideas like using camouflage, flying quickly to escape, or mimicking other insects to stay safe.
