

Name _____

Fluttering Flyers: How Moths Move

Short Answer Key

1. Moths use their two pairs of wings to fly.
2. Moths are most active at night because they are nocturnal and use their sense of smell and sight to navigate in the dark.
3. Moths avoid predators by flying quietly and using their wings to glide efficiently.
4. The hawk moth is an example of a species known for its speed.
5. Moth caterpillars move by curling their bodies into a loop and pushing forward.
