

Name _____

What Are Capybara Predators or Threats?

Open Ended Key

1. Protecting capybara habitats is important to maintain the balance of their ecosystem and ensure they have enough food and water to survive.
2. Humans can reduce their impact by preserving wetlands, avoiding hunting, and creating safe crossings near roads.
3. Capybaras use water to escape predators and stay cool in hot weather. They are excellent swimmers and can dive to avoid threats.
4. The biggest threat to capybaras might be habitat loss because it affects their ability to find food, water, and safety. Without their habitats, they are more vulnerable to other dangers.
