

Name _____

What Does a Rhinoceros Eat?

Open-Ended Response Answer Key

1. Rhinos need different types of plants because their habitats have unique plants that suit their diets and feeding methods.
2. If habitats continue to shrink, rhinos might not have enough food to survive, leading to population decline.
3. Protecting rhino habitats helps ensure these animals have enough food, water, and space to live safely.
4. A good reserve for rhinos would include grassy areas, bushes, water sources, and protection from poachers.
