## Daily Habits and Behaviors of Sea Turtles

### Open-Ended Response Answer Key

1. Sea turtles might prefer being solitary because it helps them avoid competition for food and reduces their chance of being noticed by predators.
2. Resting at night allows sea turtles to conserve energy for swimming, finding food, and migrating long distances.
3. If nesting beaches were destroyed, fewer sea turtles would be able to lay eggs, which could lead to a decline in their populations.
4. As a marine biologist, I would observe where sea turtles rest, how they interact with other animals, and how they behave during nesting season.
