## How Does a Sloth Move?

### Short Answer Key

1. Their long, curved claws help them climb trees.
2. Sloths find it difficult to move on the ground because their claws are long and make walking awkward.
3. Swimming helps sloths escape predators and move between areas.
4. A sloth's slow movement helps it avoid being noticed by predators.
5. A sloth typically moves about 120 feet in a single day.
