## Where Do Stick Insects Call Home?

### Open-Ended Response Answer Key

1. Tropical rainforests are a good habitat for stick insects because they are filled with dense vegetation, which offers plenty of food and hiding places.
2. If stick insects' habitats were destroyed, they might have nowhere to hide or find food, making it hard for them to survive.
3. As a stick insect in a forest, I would spend my day staying still on a branch, blending in with my surroundings, and eating leaves when it's safe.
4. Stick insects adapt to different habitats by using their body shape and color to blend into their surroundings, such as twigs in forests or grass in grasslands.
