

Name _____

How Do Stick Insects Reproduce?

Short Answer Key

1. Stick insects reproduce through mating or parthenogenesis.
2. Parthenogenesis is helpful because females can lay eggs even when males are not around.
3. Stick insect eggs resemble seeds, making them less likely to be eaten by predators.
4. Nymphs look like smaller, softer versions of adult stick insects.
5. Stick insects grow by molting, shedding their skin several times as they grow larger.
