## How Do Stink Bugs Move?

### Open-Ended Response Answer Key

1. The bad smell keeps predators away, which helps stink bugs stay safe from harm.
2. Climbing helps stink bugs search for food on plants, while flying lets them travel farther to find food.
3. Stink bugs are better at climbing because their legs are designed for gripping surfaces, not for running fast.
4. As a stink bug, I would climb up a plant or fly away in a zigzag pattern to escape a predator.
