## Unveiling the Anatomy of Woody Plants

### Multiple Choice Questions

1. What is the function of roots in woody plants?
  - a) Photosynthesis
  - b) Absorption of water and nutrients
  - c) Support
  - d) Gas exchange
  
2. Which part of the plant serves as a conduit for transporting water, nutrients, and sugars?
  - a) Roots
  - b) Leaves
  - c) Stem
  - d) Bark
  
3. Where does photosynthesis primarily occur in woody plants?
  - a) Leaves
  - b) Stem
  - c) Roots
  - d) Bark
  
4. What is the main function of bark in woody plants?
  - a) Gas exchange
  - b) Photosynthesis
  - c) Protection
  - d) Absorption
  
5. What is the role of cambium in woody plant growth?
  - a) Producing flowers
  - b) Absorbing water
  - c) Facilitating primary growth
  - d) Facilitating secondary growth
