Paws & Protection: A Guide to Dog Vaccinations and Veterinary Care

Short Answer Key

1. Factors such as age, lifestyle, and risk factors might influence which vaccines a dog needs.
2. Puppies typically finish their initial series of vaccinations around 16 weeks of age.
3. During regular check-ups, veterinarians conduct physical exams and discuss preventive care measures.
4. Adult dogs typically need booster shots for vaccinations annually or every three years.
5. It's important to stay proactive about your dog's veterinary care to catch any health problems early and provide the best possible treatment.
