## Threats to the Walking Leaf

### Short Answer Key

1. Birds and lizards are two predators of the walking leaf.
2. Climate change can disrupt their forest habitats by altering temperatures and rainfall patterns, affecting their food and camouflage.
3. Habitat loss and climate change are two examples of environmental threats to walking leaves.
4. Parasites like mites and ticks drain the energy of walking leaves, making them weaker and more vulnerable.
5. Camouflage helps walking leaves avoid predators by blending into their surroundings.
