

Name _____

Bug Habitats Unveiled: Exploring Where Bugs Live

Short Answer Key

1. Examples of bugs commonly found in forests include beetles, ants, and spiders.
2. Bugs found in wetland habitats have adaptations such as water-repellent exoskeletons and specialized breathing structures to survive in aquatic environments.
3. Bugs survive in desert environments by burrowing underground to escape extreme temperatures and conserve water.
4. Examples of bugs commonly found in urban areas include cockroaches, house flies, and ants.
5. Bugs adapt to survive in grassland habitats by blending in with their surroundings, using camouflage to avoid predators, and feeding on grasses and herbaceous plants.
