

Name _____

Exploring the World of Amphibians

Short Answer Key

1. Amphibian skin is soft and permeable.
2. Metamorphosis is the process where amphibians develop legs and lungs as they transition from aquatic larvae to land-dwelling adults.
3. Amphibians contribute to maintaining ecosystem balance by controlling insect populations.
4. Amphibians are considered indicators of environmental health because their presence or absence can indicate the condition of their habitat.
5. Salamanders are one type of amphibian besides frogs.
